

A Structured Cognitive Intervention Pathway as a decision-support tool for non-pharmacological interventions within a dementia care service (Innovative practice)

Mark Carter

Managing Director – Care Visions, China

Abstract:

The requirement for a structured and systematic approach to the management of Alzheimer's Disease is at the top of all government health agendas.

Individual cognitive interventions for Alzheimer's disease have been shown to be beneficial and cost effective when evaluated as sole interventions. However, there is a need for a systematic, person-centric, structured approach to guide non-pharmacological intervention selection based on disease stage, symptoms, outcome assessment, and individual requirements. Our Structured Cognitive Intervention Pathway aims to facilitate the selection of first-line, or subsequent, non-pharmacological management for people with Alzheimer's disease living at home and in elderly care facilities. The Pathway's conceptual basis and evaluation of implementation as a decision-support tool within a dementia care service in China.

Biography:

Mark has completed his MBA, Masters of Health Services Management, Masters of Advance Practice (Acute Care) and Bachelor of Nursing from Griffith University in Australia. Mark is a Clinical Associate of the University of Tasmania School of Medicine and Associate Fellow of the Australasian College of Health Service Executives

Mark is a results-driven Nurse Leader & Healthcare Executive with a 17-year track record of experience with several revolutionary outcome-driven models of healthcare delivery in Australia, Singapore and China. As Managing Director of Care Visions China, he has developed and delivered our innovative approach to the management of dementia and healthy ageing community programs. Care Visions Beijing is China's first wholly foreign owned home care company, and leader in dementia management for the last 7 years.
