

Encyclopedia of Curement per Dis-ease: proposal for Dis-eases and Curement

Encyclopedia

Ruba A M AlZeer

M.Sc. in Engineering- Systems Behavior Specialist, UAE

Abstract

Encyclopedia of Curement per Dis-ease is an Encyclopedia that lists dis-eases with a special sorting order detailed herein in this article with analysis of various types of sorting along with the proposed current suggestion. This encyclopedia refers to no single or specific reference. It does rely on different sources to fill in a template suggested by the author of this article. This article is to share the proposed structure of this Encyclopedia and to exemplify the information sourcing of the same to provide a choice of reference for the seekers of knowledge in an easily accessible way.

Biography

Ruba has completed her M.Sc in Engineering Systems Management at the age of 25 years from the American University of Sharjah and has been awarded a completion certificate from Harvard Business School in Norton-Kaplan Balanced Scorecards sciences in the field of Performance and Strategy Management. Ruba is a certified practitioner in the field of accupuncture, cupping therapy, reflexology, and several other therapies from various schools. Ruba is a freelance of her own services and has publications and literature products and has been serving as a systems' behaviour specialist.

Eversince medicine has existed as a systematic profession, dependency on outsourced medication has increased. Outsourced herein is referring to receiving out of one's home medicine for handling dis-eases. Dis-eases are the un-eases resulting in hindered processing of normal physical practices of human body and behavior. For example, Asthma is a breathing dis-ease. Stammering, is a dis-ease of behavior. Curement of such dis-eases can be found in various fields of therapies including new medicine. Despite the fact that medication is a physical option, remains the concept of receiving medicine—as a service—as an option subject to personal choices and preferences. Nations tended to have cultural ways to improve health levels. Those included acupuncture, cupping therapies, herbal therapies, reflexology, metaphysical methods, linguistic, and many other ways of curing dis- eases.

Found of essence to provide a sort of a structure for easy access by fonders of selfcare as a preventive approach at both consciously aware and subconsciously instinctly driven individuals.

The structure consists of the list of dis-eases ordered tabularly in the following order:

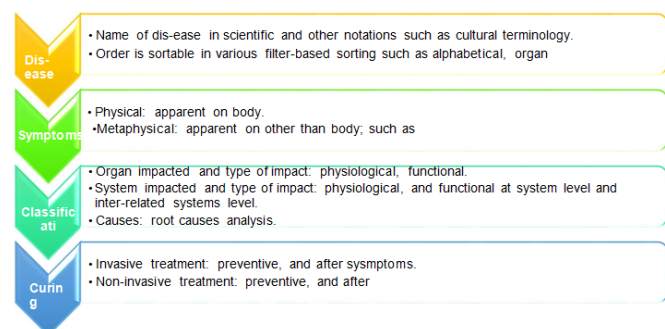

Figure 1: the structure of the tabular representation of the dynamic Encyclopedia

Where each of the organs, systems, and dis-eases are described in details and then classified narrative-wise symptoms-wise, classification-wise, healing method-wise, and dis-ease type wise. This classification assures ease of access to generic data by users of the encyclopedia whether this encyclopedia is referred to by a specialist physician or a non-medicine specialist. Yet to consider further narrative generated throughout the implementation of this exercise.

It is essential to count for the following considerations in each of the above sections of the structure:

1. Dis-eases name: terminologies assigned to dis-eases whether illnesses or otherwise in different literature references and non-literature ones such as commonly referred to by cultural norms. This includes physiological and and psychological dis-eases.
2. Symptoms: whether symptoms are correlated or not correlated to one another, appear jointly or consequently, related to one another by a cause-effect relationship or other relationships, physical type or metaphysical—whether any, some, or all of that—it is important to refer to the relationship between those symptoms and the dis-ease name and type.
3. Classification: classification of impacted class being it any classification such as organ perspective, system perspective, or other, is the main element towards making the most appropriate decision in regards to the healing method in addition to other factors impacting decision making.
4. Curing method: in addition to the personal choice of receiving medical treatment and the type of the medical treatment by a person, curing method depends mainly on the classification of the dis-ease where it is the first in place consideration to be taken care in deciding the curing method. Curing methods are classified on basis of the structure the curing method is structured based upon.

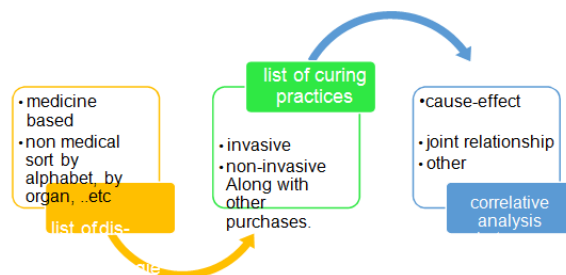

Figure 2: research methodology for data gathering of the Encyclopedia

The research methodology this encyclopedia shall be cascaded from is shown herein in the following figure:

This project is expected to continue throughout the phases of development of the structure of the project and the detailed fill up of the project with necessary data along with a dynamic element for continuous update based upon findings. The project phases are:

Figure 3: Project Phases of Development of The Encyclopedia

References for this exercise shall include:

- 1.one-to-one direct consultations with experts,
- 2.medicine books,
- 3.medicine articles and publications,
- 4.cultural reviews,
- 5.non medical, medicine related references: books, articles, publications, etc.
- 6.engineering related fields,
- 7.computer-based references,

8.systems development technologies,

9.others as appropriate.

Recommended for the work to continuously be subject to review by experts from various fields.

In conclusion, production of an encyclopedia of this size is a dynamic job that goes on continuously and requires frequent update and review by experts and parties involved in the success of the same. An e-Encyclopedia is apparently the best possible choice for assurance of freshness of data, durability, and compatability with the most recent knowledge in fields of reference to this.
