

Existing Status and Capacity of Pakistan Health System to Deal with Developing Infectious Diseases

Khurshied Ahmed Khan

Ghazi University, Pakistan

Abstract:

Multiple emerging and reproductive infections microorganisms can pose a serious threat to public health and food security all over the world. Pakistan needs to identify these threats, maintaining local, regional and global health Security issues. Regardless of the region, country and race infections are a serious threat. Emerging infectious diseases (EID) has been defined as “infections that have appeared in a new way. Emerging infectious diseases are a burden on public health and the national economy and can affect environmental, ecological and socio-economic factors of the nations. Globalization of food markets, changes in agriculture and livestock practices, climate and environmental degradation allowed new and easy passage for re-immersion of infectious agents and first appear in unusual areas. The presence of infectious and emerging infectious disease diseases can be a terrifying situation for the third World Countries like Pakistan. Pakistan have been hit a number of pandemic diseases, due to regional geographical and environmental conditions which we will discuss below. According to WHO, the country is in danger of spreading many outbreaks due to inadequate basic health care of the future planning, Improper cleaning, crowded city, inadequate number of medical practitioners and inadequate medicines, contaminated water, lack of awareness among people Public, Healthcare attention to health conditions. The gov-

ernment is dealing with a large number of refugees and internally homeless people, religious misunderstandings, and resources limitations. Due to limited resources and financial constraints according to recent data, Pakistan spends 4.7% of its total budget on health care, which is not enough for the fifth populate country in the world. Due to defects in health care practices and environmental conditions, pandemic diseases always
