

Viral associations in acute demyelinating diseases of nervous system: Epstein-Barr virus and Measles more capable

Janak Kishore

Sanjay Gandhi Post Graduate Institute of Medical Sciences, India

Acute demyelinating diseases involves inflammation/selective destruction of myelin in the nervous system triggered by pathogenic viruses/bacteria usually in post-infectious/para-infectious period and may induce auto-antibodies to myelin. Owing to its rarity, studies are limited with individual virus hence this is the first report from India testing for six viruses.

Ninety two cases (predominantly males) of acute demyelinating diseases (2007-2012) attending this tertiary care institute were tested for recent viral infection by determining virus specific IgM antibodies by ELISA. Of 92 cases 43 had Guillain-Barré syndrome (GBS) (≤ 30 yrs) with upper respiratory tract infection, diarrhea and lower limb paresis. Twenty two had acute transverse myelitis (ATM, 10-20 yrs and 41-50 yrs) presented with fever, progressive proximal leg weakness, bladder dysfunction and inflammatory signs in spinal MRI. In 27 acute disseminated encephalomyelitis (ADEM, ≤ 30 yrs) most had fever, malaise, headache, vomiting with focal or multifocal neurological deficit. In GBS herpes simplex (HSV1+2), cytomegalovirus (CMV), Epstein-Barr virus (EBV), varicella zoster (VZV), measles and parvovirus B19 (B19) infection (n=13; 30%) were found in 2, 3, 6, 0, 2, 0 cases respectively. In ATM 3 had measles and 2 had CMV and in ADEM 3 had measles, 2 had HSV1+2 and one each had CMV and EBV.

Overall 25 (27.2%) cases had measles (n=8), EBV (n=7) and CMV (n=8) but none had VZV or B19 infection. EBV causes polyclonal activation while measles virus is neurotropic hence the two can cause demyelination (n=15) in CNS more often. Recovery was complete in 3-4 wks with intravenous corticosteroid/supportive treatment but four persisted with lower limb weakness and one patient died (ATM).

Biography

Janak Kishore is Chief of Serology and Molecular Virology in the department of Microbiology, Sanjay Gandhi Post-graduate Institute of Medical Sciences, India. He was Associate Editor of Indian Journal of Virology, member national academy medical sciences, American societies and Fellow of JICA, Japan. He taught for over 30 yrs with pioneer work on parvovirus B19, developed in-house PCR and ELISA, published three novel clinical associations of B19. He also worked on cytomegalovirus, enteroviral hemorrhagic conjunctivitis, rubella etc. He published over 50 papers, was reviewer for reputed journals, organized conferences, chaired sessions and frequently invited to speak in international conferences.
