Cystic nephroma – A diagnostic dilemma

Anukriti Sood, Pinakin Patel, Suresh Singh and Raj Govind Sharma
SMS Medical College, Jaipur, India

Multicystic nephroma is a relatively rare, non-genetic, unilateral, lesion of the kidney which has a bimodal distribution. The nonspecific clinical findings and the poor contribution of imaging examinations make the preoperative diagnosis a diagnostic dilemma and difficult to differentiate from other cystic renal neoplasia. We report a case of cystic nephroma in a 40 year old female who presented with a right sided abdominal lump and pain abdomen since 6 months. After a series of examinations including abdominal ultrasound and computed tomography, she underwent right partial nephrectomy and diagnosis was confirmed on histopathology. Final diagnosis can be only established by the histopathological examination of the completely excised tumour in the pathology laboratory.

Biography

Anukriti Sood had completed her MBBS at the age of 25 years from SSR Medical College, University Of Mauritius and postdoctoral studies (M.S. General Surgery) from Government Medical College, Amritsar, India in 2014. She had been trained in Tata Memorial Centre, Mumbai, a premier institute of oncology in India. She had completed few years of senior residency in S.M.S Medical College, Jaipur, in Department of Surgical Oncology. Presently, she is working as MCh resident in Department of Breast and Endocrine surgery, AIIMS, New Delhi. She has presented lot of papers in various national and international conferences.
